fixtures

Unlike past years where multiple examples of fixtures were showcased as available readymade lines, this EuroShop focused more on the capabilities, imagination, and unique combination of materials; some being high-tech, others being high-touch -- all designer inspirations. Bringing together old world design and craftsmanship, juxtaposed (and some would argue "in collision") with high-tech, streamlined, engineered and contorted fixtures of glass and steel was a consistent theme.

Fixtures, acting as a "frame" for unique backgrounds and materials be they living walls, dried and collected natural materials, titanium metals in vibrant jewel tones, stretch fabrics, and even activated through the integration of technology (whether lighting or digital output) added to the forward cycle renewability. Their armatures focused on functions, operation and long life, while their inserts were more ready for renewal as the trends evolved. Particularly interesting were the fixtures in the food areas, which in many cases set their eyes on next millennium ahead; curvilinear, swooping, and dramatic but, as often, blended with the found and the reclaimed.

Using materials that were outcomes of technology -- fixtures were laser cut, formed, cast, contorted, and organic -- was another theme, with many fixture manufacturers literally "thinking out of the box" from a standpoint of moving away from standard rectangular and "90 degrees" of fabrications, to those whose shape and form were indeterminate and flowing. The integration of lighting and power in fixtures, allowing the new array of devices from lighting to screens to be seamlessly integrated into fixtures and service with a pre-thought kit of parts, provided even fewer limits and more possibilities for the creative designer.

contours	
	İ
fixtures feature three-dimensional contour shapes created from the combination of multiple flat plane objects in consecutive sizes to visually illustrate the flat, yet contoured and segmented surfaces
